

No-Code Dataset Preparation Platform

A No Code approach towards data cleaning and preprocessing

Mentor: Asmita Ingale

Mentee: Dhruva Tikhe

Why Data Analysis Section?

Implement a no code system for Basic Exploratory Data Analysis. This allows users to view information about the data which in turn helps users to make correct preprocessing decisions. Numerical analysis of data is very important, especially when given data is going to be used for machine learning applications.

Scope

Implement methods to identify unique values, sum of blank values, obtain statistical reference table and view general information about the columns of the dataset. These are all python/pandas functions which are used in code very often and can help a lot in the no code GUI based application as it makes the data transformation more intuitive.

Feasibility

Like the preprocessing modules, this too will be implemented as a modular concept of building separate components. But as per registry metadata this whole section will be under 'analysis' rather than 'preprocessing' since the dataset/dataframe is not going to be modified by these operations.
